

## Interviews Workshop - Scenario and Tasks

### Scenario:

A city has been affected by widespread flooding that has caused considerable damage to the Built Environment - transport infrastructure

has been severely affected and so have residential, commercial and institutional buildings.

Your research interests relate to the impact of flooding on the urban built environment and how flooding is perceived and dealt with by society.

### Task:

Identify a research problem related to how flooding is perceived by society (or impacted group(s) within that society). Design a study to investigate the problem using qualitative research interviews:

1. What are the aim/objectives/research questions of your study?
2. Who are your target respondents? What is your sampling strategy?
3. What ethical issues need to be considered in the design of your study and how would you address them?
4. Develop a draft interview guideline and some example questions that you might use during the study.
